Education

HMR Institute of Technology and Management Delhi, India
B.Tech in Computer Science Engineering 2021 - 2025

Skills

Languages, Tools & Data Analytics: Python, SQL, Pandas, NumPy, Excel, Power BI, Tableau, Seaborn

Machine Learning & AI: Scikit-Learn, TensorFlow, PyTorch, Deep Learning (CNN, RNN, LSTM, Transfer Learning)

NLP & Generative AI: NLTK, BERT, GPT Fine-tuning, Transformer Architecture, RAG, LangChain, Agentic AI

MLOps & Cloud Computing: DVC, Docker, MLflow, AWS (SageMaker, S3, EC2), Git, GitHub

Experience

AI Engineer, **Isourse** – Delhi, India August 2025 – Present

- **Built a RAG system within the CRMS** using **Gemini File Search** and product-specific document stores to generate BRDs, acceptance criteria, and dependency maps, reducing **BA** documentation time by **50%**.
- **Developed an AI-driven change-request** rewriting pipeline for the **CRMS** that enriched incomplete client submissions via contextual retrieval, improving request quality and **cutting processing time by 30%**.
- **Implemented a production-ready Nixtla-based time-series** pipeline for intermittent gig-worker demand forecasting across 5 designations and 40+ cities, with automated ingestion, validation, and cleaning.
- **Trained and cross-validated AutoNHITS** and **AutoLSTM** on 80+ series with automatic best-model selection and scheduled weekly retraining to keep forecasts current.
- **Optimized CRM lead generation scoring by 55%** using **LLM prompt** engineering and an **ensemble NLP** approach, preventing bad-fit companies from receiving inflated scores.
- **Implemented a weighted text similarity** layer combining **cosine** semantic similarity, **Jaccard/keyword** overlap, and a custom **LLM prompt** function between product information and client requirements to generate more reliable lead scores.

AI Developer Intern, **Buyogo** – Noida, UP,India May 2025 – July 2025

- **Built an analytical chatbot** that enables natural language querying across **40+ apparel operations SQL tables** by designing a custom few-shot–based SQL generation framework, **achieving 85%** accuracy on complex queries.
- **Developed a Retrieval-Augmented Generation (RAG)** knowledge base chatbot to assist new users and clients in navigating the product; improved BLEU score by **30% (from 0.60 to 0.78)** using Flash Reranker and other advanced techniques.
- **Created backend APIs, including a reset API** to reinitialize the vector DB pipeline and a **feedback API** with like/dislike ratings; reduced manual reset time by 70% and enabled iterative model improvement through user input.
- **Containerized the complete application stack** (Streamlit UI, backend APIs) using Docker; created production-ready images to streamline deployment and manage dependencies.

Generative AI Intern, **Everyday Series** – London, UK (Remote) April 2025 – June 2025

- **Developed Micro SaaS** products for solopreneurs, leveraging Generative AI solve niche problems.
- **Created an autonomous multi-agent** system that identified real-time discounts, cutting search time by 70%.
- **Utilized no-code/low-code tools** like Loveable AI and Supabase to optimize backend automation and UI/UX workflows.
- **Built workflow automations with n8n** to orchestrate AI agents, APIs, and databases, reducing manual ops by

80%.

- **Integrated n8n with LLMs and third-party services** (Stripe, email, webhooks) to enable real-time data syncing and event-driven actions.

Data Science Intern, **Tata Power DDL** – Delhi, India July 2024 – August 2024

- **Developed time series models** to forecast customer service call volumes, optimizing staffing and improving operational efficiency.
- **Conducted EDA to identify** seasonal trends, peak call times, and differences between holidays and non-holidays.
- **Performed stationarity checks** using ADF and KPSS tests; applied first-order differencing for model stability.
- **Evaluated models** using MAPE: **SARIMA** (68.67), **SARIMAX** with exogenous variables (58.79), and **LSTM** (21.67).
- **Implemented LSTM model for final predictions,** achieving the lowest MAPE and enhancing forecast accuracy.

Projects

Log Classification Framework: Hybrid log classification framework combining Regex, NLP models, and LLMs (including DeepSeek via Groq) Project Link

Toxic Comments Detection: BiLSTM model to detect toxic comments across six categories with 83.7% precision and 68.1% recall. Project Link
