Roles & Responsibilities:

I work as an AI/ML Engineer handling end-to-end ML development including data preprocessing, time-series feature engineering, building models (LSTM, XGBoost), API deployment, and monitoring in production.

I used raw vitals, lag features, rolling stats, trend, time features, and patient context to capture short-term and long-term patterns in time-series data.

Tools & Technologies:

Python, SQL, Pandas, NumPy, Scikit-learn, PyTorch, XGBoost, FastAPI, PostgreSQL, basic Azure, Docker.

Project Duration:

Around 3+ years (built in multiple phases from model development to production deployment).

Team Size & Role:

Worked in a small team (4 members) with data engineers and backend developers. I owned the ML module and coordinated deployment with the team.
