Project-Logistics Market Forecasting

Developed a time series forecasting system to forecast market inflections and optimize multi-modal

transportation capacity.

➢ Built time-series forecasting models using Auto ARIMA, and machine learning models using XGBoost.

➢ Integrated macro-economic indicators and internal logistics data to predict lead-time variability and market shifts.

➢ Quantified the reduction in safety stock requirements and improved overall customer experience and employee

experience.

Tools and Technologies:- Python, Power BI, Data Science, Azure.

Team Size: 6

Duration: 12 months

Project-HS Classification

➢ Implemented a production-grade machine learning solution to automate the HS classification for global products,

improving accuracy and efficiency in the trade operations.

➢ Engineered a high-accuracy classification system, achieving overall accuracy of 86%.

➢ Designed ADF pipelines to ingest source data and also collected data via scrapping.

➢ Developed a robust preprocessing pipeline, performed feature engineering and captured complex chemical

properties.

➢ Streamlined the trade operations by building a daily classification pipeline.

Tools and Technologies:- python, Data Science, Azure, Web scraping, frontend and backend technology

Team Size: 8

Duration: 24 months

Project-Incident Categorization

➢ Specialized in supervised learning within the IT Service Management (ITSM) domain, focusing on reducing human

effort and time spent on repetitive tasks.

➢ Developed a machine learning model for incident categorization, achieving an accuracy rate of 83%.

➢ Utilized techniques such as tf-idf, count vectorizer, word2vec, and BERT for embedding generation.

➢ Leveraged open-source large language models (LLMs) for text classification by fine tuning, enhancing task

accuracy to 92%.

Tools and Technologies:- Python, Azure, NLP, LLM, Hugging face, fine tuning

Team Size: 2

Duration: 6 months

Project-Facility Utilization

➢ Engineered a “single source of truth” for facility utilization by reconciling disparate datasets using advanced string

matching techniques to overcome inconsistent naming conventions.

➢ Optimized global real estate footprint by providing data-driven insights that enabled the client to decommission

1MM+ sq. ft. of underutilized office space, resulting in a 10% reduction in annual rent payments

Tools and Technologies:- Python, NLP, Fuzzy Name Matching, Power BI

Team Size - 3

Duration:- 12 months
